

**MATH W4051 PROBLEM SET 8**  
**DUE OCTOBER 27, 2009.**

INSTRUCTOR: ROBERT LIPSHITZ

- (1) Munkres 51.1
- (2) Munkres 51.2
- (3) Munkres 51.3
- (4) Let  $\text{Homeo}(X)$  denote the set of homeomorphisms  $f: X \rightarrow X$ .
  - (a) Explain briefly why  $\text{Homeo}(X)$  is a group. Explain briefly how  $\text{Homeo}(X)$  acts on  $X$ . (If you've forgotten, look up what "acts on" means in a book on group theory.)
  - (b) Show that for any nonempty spaces  $X$  and  $Y$  there is an injective group homomorphism  $\text{Homeo}(X) \rightarrow \text{Homeo}(X \times Y)$ .
  - (c) Show that  $\text{Homeo}(S^1)$  acts *transitively* on  $S^1$ . That is, show that for any points  $x, y \in S^1$  there is an element  $\phi \in \text{Homeo}(S^1)$  so that  $\phi(x) = y$ . (Hint: this should be easy.) Conclude that  $\text{Homeo}(S^1)$  is uncountable.
  - (d) Let  $X$  be the union of the  $x$ - and  $y$ -axes in  $\mathbb{R}^2$ , with the subspace topology (so  $X$  is shaped like an  $X$ ). Prove that  $\text{Homeo}(X)$  does *not* act transitively on  $X$ . (This takes a little insight.)
  - (e) Find a space  $X$  with at least 3 points so that  $\text{Homeo}(X)$  is the trivial group.
  - (f) Optional, challenge problem: can you find an infinite subspace  $X$  of  $\mathbb{R}^n$  such that  $\text{Homeo}(X)$  is the trivial group?
