MINIMAL SURFACES IN THE THREE SPHERE

In fond remembrance of Gene Calabi

A minimal surface in S^3 is a regular surface Σ such that for any compactly supported variation Σ_t , $|t| < \epsilon$

$$\left. \frac{d}{dt} \operatorname{Area}(\Sigma_t) \right|_{t=0} = 0.$$

э

∃ ⊳

A minimal surface in S^3 is a regular surface Σ such that for any compactly supported variation Σ_t , $|t| < \epsilon$

$$\left.\frac{d}{dt}\operatorname{Area}(\Sigma_t)\right|_{t=0} = 0.$$

This is equivalent to the

vanishing of the mean curvature of the surface.

A minimal surface in S^3 is a regular surface Σ such that for any compactly supported variation Σ_t , $|t| < \epsilon$

$$\left.\frac{d}{dt}\operatorname{Area}(\Sigma_t)\right|_{t=0} = 0.$$

This is equivalent to the

vanishing of the mean curvature of the surface.

It is also equivalent to a certain differential equation.

As I said before

This disk is a regular analytic surface at P_1 .

As I said before

This disk is a regular analytic surface at P_1 .

We now reflect this surface around the point Q_1 where the angle of the boundary is $2\pi/(k+1)$.

As I said before

This disk is a regular analytic surface at P_1 .

We now reflect this surface around the point Q_1 where the angle of the boundary is $2\pi/(k+1)$.

This gives a compact minimal surface

 $\xi_{m,k} \subset S^3$

We have a triangulation of S^3 into 4(m+1)(k+1) congruent spherical simplicies.

Our surface lies in half of these in a checkerboard array.

Any minimal embedding of a compact surface into S^3 is unknotted.

→

э

Any minimal embedding of a compact surface into S^3 is unknotted.

In particular, any minimal embedding of the torus can be taken to the Clifford torus by a diffeomorphism.

Any minimal embedding of a compact surface into S^3 is unknotted.

In particular, any minimal embedding of the torus can be taken to the Clifford torus by a diffeomorphism. In this paper in 1970 I conjectured that **The Clifford torus is the only embedded minimal torus in** *S*³

Any minimal embedding of a compact surface into S^3 is unknotted.

In particular, any minimal embedding of the torus can be taken to the Clifford torus by a diffeomorphism. In this paper in 1970 I conjectured that **The Clifford torus is the only embedded minimal torus in** *S*³ After many failed attempts over the years:

Theorem (Simon Brendle, 2012)

The conjecture is true
THE SURFACES $\eta_{m,k}$

Theorem:

To each ordered pair of positive integers (m, k), where k is odd, there corresponds a compact, non-orientable minimal surface $\eta_{m,k}$ containing $\gamma_{m,k}$ and having Euler characteristic 1 - mk.

THEOREM

Every compact orientable surface can be minimally embedded into S^3 . Every non-orientable surface can be minimally immersed into S^3 except for the real projective plane which is prohibited by Almgren's theorem.

Given a compact oriented surface and a minimal immersion

 $\Psi:\Sigma\subset\textit{S}^3$

there is an associated polar map

 $\Psi^*:\Sigma\subset \textit{S}^3$

э

Given a compact oriented surface and a minimal immersion

 $\Psi:\Sigma\subset S^3$

there is an associated polar map

 $\Psi^*:\Sigma\subset S^3$

which is **minimal** with **branch points** where K = 1 for Ψ

э

Given a compact oriented surface and a minimal immersion

 $\Psi:\Sigma\subset S^3$

there is an associated polar map

 $\Psi^*:\Sigma\subset S^3$

which is **minimal** with **branch points** where K = 1 for Ψ $\Psi(x)$ is just the unit normal to Ψ at x.

 $\Psi^{**}~=~\Psi$
