1. If $M, N$ are compact oriented manifolds, $f, g : M \to N$ are (smoothly) homotopic, and $\omega \in \Omega^p(N)$ is closed, show that
   $$\int_M f^* \omega = \int_M g^* \omega.$$ 

2. Use de Rham cohomology to prove that $\mathbb{R}^2 \setminus 0$ is not diffeomorphic to a contractible open subset of $\mathbb{R}^2$. 

3. Let $M \subset \mathbb{R}^n$ be a manifold, $\{\psi_\alpha : V_\alpha \to M \cap U_\alpha \mid \alpha \in A\}$ an atlas, $V_{\alpha\beta} = \psi_\alpha^{-1}(U_\beta)$, and $f_{\alpha\beta} = \psi_\alpha^{-1} \circ \psi_\beta : V_\beta \to V_\alpha$. Recall that $\Omega^p(M)$ was defined in class as the subset of $\prod_{\alpha \in A} \Omega^p(V_\alpha)$ consisting of forms $\omega_\alpha$ such that $\omega_\alpha|_{V_{\alpha\beta}} = f_{\alpha\beta}^* \omega_\beta$. 
   (a) Let $S = \{\omega \in \Omega^p(\mathbb{R}^n) \mid \text{for all } x \in M \text{ and } v_1, \ldots, v_p \in T_x M, \omega(v_1, \ldots, v_p) = 0\}$. Prove that there is a natural isomorphism $\Omega^p(\mathbb{R}^n)/S \cong \Omega^p(M)$ and use a partition of unity to show that it is surjective. 
   (b) Show that the definition of $\Omega^p(M)$ given in class does not depend on the atlas. 

4. Let $F : \mathbb{R} \to S^1 \subset \mathbb{R}^2$ be $F(t) = (\cos t, \sin t)$. 
   (a) Carefully show that the image of $F^* : \Omega^0(S^1) \to \Omega^0(\mathbb{R})$ is
      $$\{f(t) \in \Omega^0(\mathbb{R}) \mid f(t + 2\pi) = f(t)\},$$
   and that the image of $F^* : \Omega^1(S^1) \to \Omega^1(\mathbb{R})$ is
      $$\{g(t) dt \in \Omega^1(\mathbb{R}) \mid g(t + 2\pi) = g(t)\}.$$ 
   Hint: use the previous problem and a judicious choice of atlas on $S^1$. 
   (b) Use this to prove that $H^1(S^1) \cong \mathbb{R}$. 

5. Stereographic projection. 
   Let $\mathbb{R}^{n+1}$ have coordinates $(x_0, \ldots, x_n)$, and let $S^n = \{\vec{x} \in \mathbb{R}^{n+1} \mid \|\vec{x}\| = 1\}$. 
   (a) For any $\vec{y} \neq \vec{e}_0 \in S^n$, find a formula for the unique point $\vec{z}$ on the line through $\vec{y}$ and $\vec{e}_0$ and on the plane $x_0 = 0$. Draw a picture. 
   (b) Carefully show that $S^n \setminus \{\vec{e}_0\}$ is diffeomorphic to $\mathbb{R}^n$. 
   (c) Show also that $S^n \setminus \{\pm \vec{e}_0\}$ is diffeomorphic to $S^{n-1} \times \mathbb{R}$.
