## Theorem

The alternating group  $A_5 \subset S_5$  is a simple group of order 60.

In fact we have the general theorem:

### Theorem

For any  $n \ge 5$ , the alternating group  $A_n \subset S_n$  is a simple group of order  $\frac{n!}{2}$ .

### Theorem

*The alternating group*  $A_5 \subset S_5$  *is a simple group of order* 60.

In fact we have the general theorem:

#### Theorem

For any  $n \ge 5$ , the alternating group  $A_n \subset S_n$  is a simple group of order  $\frac{n!}{2}$ .

- 5 = 5; a 5-cycle is the product of 4 transpositions, hence is even.
- 5 = 4 + 1; a 4-cycle is the product of 3 transpositions, hence is odd.
- 5 = 3 + 2; a 3-cycle is the product of 2 transpositions, hence its product with a disjoint transposition is odd.
- 5 = 3 + 1 + 1; a 3-cycle is even.
- 5 = 2 + 2 + 1; an even product of two disjoint 2-cycles.
- 5 = 2 + 1 + 1 + 1; a 2-cycle is odd.
- 5 = 1 + 1 + 1 + 1 + 1; the identity is even.

More precisely, let  $g \in A_5$ , with centralizer  $C_g \subset S_5$ ,  $C'_g \in A_5$ . So Then the conjugacy class  $[g] \subset S_5$  has order  $|S_5|/|C_g|$ , the  $A_5$ -conjugacy class  $[g]' \subset A_5$  has order  $|A_5|/|C'_g|$ . In particular, |[g]'must divide  $60 = |A_5|$ . This shows that not all 5 cycles are conjugate in  $A_5$ .

### Lemma

Let  $g \in A_5$ . Then its conjugacy class [g] in  $S_5$  is the union of either 1 or 2 conjugacy classes in  $A_5$ ; if there are 2 then they are both of the same size.

More precisely, let  $g \in A_5$ , with centralizer  $C_g \subset S_5$ ,  $C'_g \in A_5$ . So Then the conjugacy class  $[g] \subset S_5$  has order  $|S_5|/|C_g|$ , the  $A_5$ -conjugacy class  $[g]' \subset A_5$  has order  $|A_5|/|C_g|$ . In particular, |[g]'must divide  $60 = |A_5|$ . This shows that not all 5 cycles are conjugate in  $A_5$ .

## Corollary

There are two conjugacy classes of 5-cycles in  $A_5$ , and one conjugacy class of products of disjoint 2-cycles.

Proof of corollary: Since 24 does not divide 60, the 5 cycles form more than 1, thus 2 conjugacy classes; but 15 is not even, so it is a single conjugacy class.

## Corollary

There are two conjugacy classes of 5-cycles in  $A_5$ , and one conjugacy class of products of disjoint 2-cycles.

Proof of corollary: Since 24 does not divide 60, the 5 cycles form more than 1, thus 2 conjugacy classes; but 15 is not even, so it is a single conjugacy class.

## We can now prove that $A_5$ is simple. Let $N \subset A_5$ be a normal

**subgroup.** It is the union of conjugacy classes, and its order divides 60, and it must contain the identity. The partition of 60 into the orders of conjugacy classes is either

$$60 = 1 + 12 + 12 + 15 + 20$$

(which is in fact correct) or

$$60 = 1 + 12 + 12 + 15 + 10 + 10.$$

The proper divisors of 60 bigger than 10 are 12, 15, 20, 30. No partial sum of these partitions adds up to one of these divisors. So the only possible N are  $A_5$  and the identity.

We can now prove that  $A_5$  is simple. Let  $N \subset A_5$  be a normal subgroup. It is the union of conjugacy classes, and its order divides 60, and it must contain the identity. The partition of 60 into the orders of conjugacy classes is either

$$60 = 1 + 12 + 12 + 15 + 20$$

(which is in fact correct) or

$$60 = 1 + 12 + 12 + 15 + 10 + 10.$$

The proper divisors of 60 bigger than 10 are 12, 15, 20, 30. No partial sum of these partitions adds up to one of these divisors. So the only possible N are  $A_5$  and the identity.

> < 同 > < 三 > <</p>

Let *X* be the set of  $A_5$  conjugacy classes contained in [g]. We let  $S_5$  act on *X* by conjugation: clearly  $[h]' \subset [g]$  if and only *h* is conjugate to *g* in  $S_5$ . Moreover, the action of  $S_5$  on *X* is transitive, by definition. The stabilizer  $S_{[g]'} \subset S_5$  contains  $A_5$ , again by definition. Thus either  $S_{[g]'} = A_5$  or  $S_{[g]'} = S_5$ . If  $S_{[g]'} = S_5$  then [g]' = [g], and [g] contains only one  $A_5$ -conjugacy class. Otherwise,  $[g] = [g]' \coprod [h]'$  for some  $h = sgs^{-1}, s \in S_5 \setminus A_5$ . Let *X* be the set of  $A_5$  conjugacy classes contained in [g]. We let  $S_5$  act on *X* by conjugation: clearly  $[h]' \subset [g]$  if and only *h* is conjugate to *g* in  $S_5$ . Moreover, the action of  $S_5$  on *X* is transitive, by definition. The stabilizer  $S_{[g]'} \subset S_5$  contains  $A_5$ , again by definition. Thus either  $S_{[g]'} = A_5$  or  $S_{[g]'} = S_5$ . If  $S_{[g]'} = S_5$  then [g]' = [g], and [g] contains only one  $A_5$ -conjugacy class. Otherwise,  $[g] = [g]' \prod [h]'$  for some  $h = sgs^{-1}$ ,  $s \in S_5 \setminus A_5$ . Let *X* be the set of  $A_5$  conjugacy classes contained in [g]. We let  $S_5$  act on *X* by conjugation: clearly  $[h]' \subset [g]$  if and only *h* is conjugate to *g* in  $S_5$ . Moreover, the action of  $S_5$  on *X* is transitive, by definition. The stabilizer  $S_{[g]'} \subset S_5$  contains  $A_5$ , again by definition. Thus either  $S_{[g]'} = A_5$  or  $S_{[g]'} = S_5$ . If  $S_{[g]'} = S_5$  then [g]' = [g], and [g] contains only one  $A_5$ -conjugacy class. Otherwise,  $[g] = [g]' \prod [h]'$  for some  $h = sgs^{-1}$ ,  $s \in S_5 \setminus A_5$ . Let *X* be the set of  $A_5$  conjugacy classes contained in [g]. We let  $S_5$  act on *X* by conjugation: clearly  $[h]' \subset [g]$  if and only *h* is conjugate to *g* in  $S_5$ . Moreover, the action of  $S_5$  on *X* is transitive, by definition. The stabilizer  $S_{[g]'} \subset S_5$  contains  $A_5$ , again by definition. Thus either  $S_{[g]'} = A_5$  or  $S_{[g]'} = S_5$ . If  $S_{[g]'} = S_5$  then [g]' = [g], and [g] contains only one  $A_5$ -conjugacy class. Otherwise,  $[g] = [g]' \coprod [h]'$  for some  $h = sgs^{-1}$ ,  $s \in S_5 \setminus A_5$ . It remains to show that

$$|[h]'| = |[sgs^{-1}]'| = |[g]'|,$$

in other words, that

$$s: [g]' \to [h]'; aga^{-1} \mapsto s(aga^{-1})s^{-1} = (sas^{-1})sgs^{-1}(sas^{-1})^{-1}$$

is a bijection.

But conjugation by  $s^{-1}$  is the inverse bijection, so we are done.

It remains to show that
