

GROUP AXIOMS:

- **Closure:** for all $x, y \in G$
 $x * y \in G$
- **Associativity:** for all $x, y, z \in G$
 $(x * y) * z = x * (y * z)$
- **Identity element:** there is $e \in G$ s.t.
 $ex = x$ and $xe = x$ for all $x \in G$.
- **Inverses:** for all $x \in G$ there is $x^{-1} \in G$ s.t.
 $xx^{-1} = e$ and $x^{-1}x = e$

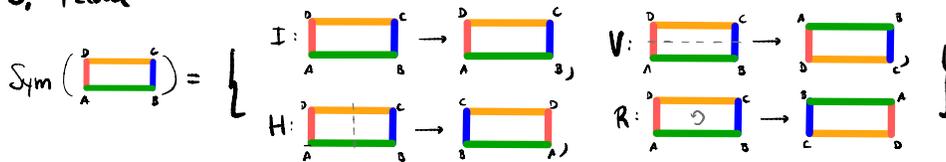

13. Group Theory

1. Decide whether the following sets and operations form groups:

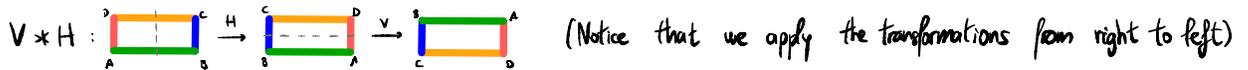

- a) $(\mathbb{R}, +)$ d) $([1, \infty), \cdot)$
 b) $([-1, 1], +)$ e) $(\{ \equiv, \neq, \times, \div \}, \cdot)$
 c) $([0, \infty), \cdot)$ f) $(\{ \equiv, \neq, \times, \div \}, \cdot)$

2. Let $C_2 \times C_2$ be the group with set $\{(0,0), (0,1), (1,0), (1,1)\}$ and operation given by addition modulo 2, so for example $(1,0) + (1,1) = (2,1) = (0,1)$. Write down the operation table and prove that $C_2 \times C_2$ is indeed a group.

3. Recall

with multiplication given by successive application of the maps, for instance

therefore $V * H = R$.

Write down the operation table for $\text{Sym}(\square)$. Do you see any similarities with that in 2?

4. a) Let $G = \langle a \mid a^7 = 1 \rangle$. Find the 7 elements of G .

b) Let $G = \langle a, b \mid a^3 = 1, b^2 = 1, ba = a^2b \rangle$. Prove that $abab = 1$, $(ab)^{-1} = ba^2$, and simplify ba^2b .

c) Let $G = \langle a, b \mid a^4 = 1, b^2 = 1, ba = a^3b \rangle$. Find the 8 different elements in G .

5. How many elements does $\text{Sym}(\triangle)$ have? (These are the symmetries of an equilateral triangle)

Find a presentation of $\text{Sym}(\triangle)$ using 2 generators. You may check your answer using the following Sage code:

```

1 F.<a,b>=FreeGroup(2)
2 rels=[a^2,b^2,a*b*a]
3 G=F/rels
4 S=SymmetricGroup(3)
5 G.is_isomorphic(S)
    
```

(This returns false because the relations are wrong)

(You may use $G.order()$ to find the number of elements of G)

6. (Harder): Find presentations for:

a) The group of symmetries of a regular polygon (2 generators)

b) The group of permutations of $1, 2, \dots, n$. ($n-1$ generators)

14. The knot group

1. Compute the following knot groups, using the given diagrams.

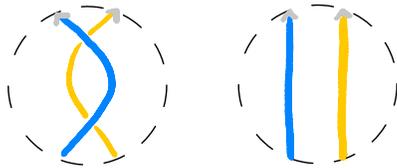

a) $\pi(\bigcirc)$

b) $\pi(\infty)$

c) $\pi(\bigcirc \cup \bigcirc)$

2. Consider link diagrams D_1 and D_2 which only differ in the region inside the dashed circles below.

Prove that both D_1 and D_2 will have equivalent relations:

3. (Challenge) Prove that $\pi(L)$ is infinite for any link L .

4. (Challenge) Find two knots K_1, K_2 that are different but such that $\pi(K_1) = \pi(K_2)$.
